construction

RadioPro provides best-in-class VoIP for two-way digital radios to allow communication from anywhere on conventional or trunked systems. RadioPro combines the flexibility to solve any Radio-over-IP challenge, ease of wide-area system deployment, and cost savings over other solutions. Enhance radio system functionality with the following RadioPro software applications for Windows™ PCs and notebooks and smart mobile devices.

RadioPro Dispatch is a multi-channel Windows™ desktop console, with optional modules for GPS tracking, voice dispatch, text messaging, and more!

RadioPro Talk is a low-cost alternative to tone-remotes, giving its users the functionality of a virtual radio on a Windows™ desktop, while focusing on simplicity.

RadioPro Mobile, is available for iOS and Android devices, enabling mobile users communication with two-way radios using simple push-to-talk.

Efficient digital two-way radio communication is required between contractors and a central office to monitor the safety of workers, locate assets, provide reports of user travel, and to review safety incidents. Affordable and easy to use, **RadioPro** provides the solution contractors need to keep in touch with work crews, inside and outside of radio coverage.

Whether a radio user is at a job site, or traveling between job sites, RadioPro Dispatch will enable an office team to easily communicate with field personnel. Features such as superb audio quality, intuitive interface, selected and

Key Features For Contractors:

- Multi-Chanel Voice Dispatch
- iOS & Android Mobile App
- Lone Worker & Man-down
- Monitoring
- GPS/AVL Tracking
- Data Reports
- Archive Search & Filter
- Custom Action Buttons

un-selected audio, missed-call tracking, instant playback, emergency call, and patching will improve immediate communication with work crews to avoid errors and accidents at job sites.

When used with digital two-way radios, the optional GPS module allows site supervisors to track the location of workers. With features such as Geo-fences, Area Markers, and Trail Crumbs, RadioPro will display current and previous locations of radio users. Status indicators will show the duration of time that a vehicle has been stopped, or the speed at which it is moving, and if the vehicle has entered or left certain designated areas.

CTI Products' RadioPro software includes the RadioPro Mobile application for iOS and Android devices. This application gives mobile users the ability to reliably communicate with two-way radio systems inside and outside of radio coverage. By using existing cellular coverage that many employees already have, a radio system has a much wider coverage area. Therefore, great cost savings can be experienced when compared to expanding the RF coverage of the radio system.

Since all voice calls, text messages, and GPS/AVL data is logged to RadioPro databases, reports and safety incident review is available. A management team can easily search, filter and review events recorded at a particular job site. Voice calls of interest may be merged together for a seamless replay of an incident. Reports are also available to show how long a user stops at a location, a user's speed during travel, a user's radio voice call usage, and other important operation data.

CTI Products is pleased to announce the merger of two of its software applications. TurboVUi and RadioPro were introduced to provide digital two-way radio users with a means to enhance their digital radio communication. TurboVUi will soon be incorporated into **RadioPro** to strengthen our product offerings. RadioPro will offer all of the features and benefits TurboVUi users have come to expect, including the same high quality service.
